

SALES ANALYSIS DASHBOARD USING POWER BI

A Business Analytics Report

NAME: KAIF SAYYED

COURSE: BUSINESS ANALYST

INSTITUTION: COACHX

BATCH CODE: CX-134

Key Factors

- Introduction
- Methodology
- Requirement Analysis
- Other Parameters depending upon the projects
- All Visualization like All Charts which is there in the documents
- Insights from the Charts as well as Dashboards
- Conclusion

INTRODUCTION

This project titled “Sales Analysis Dashboard using Power BI” focuses on analyzing sales data provided by the institution to understand business performance. The dataset contains information related to orders, customers, products, sales, profit, discounts, shipping modes, and regional details.

The main objective of this project is to convert raw sales data into meaningful insights using data cleaning, calculations, and visualizations in Power BI to support effective business decision-making.

METHODOLOGY

The project was carried out using Power BI Desktop. Initially, the dataset was loaded into Power BI and explored to understand the structure of the data. Data cleaning and transformation tasks were performed using Power Query, such as filtering records, removing duplicates, splitting columns, and creating custom columns.

After data preparation, DAX measures were created to calculate key metrics such as total sales, total profit, profit margin, cumulative sales, and year-over-year growth. Various charts and visuals were then designed to analyze sales trends, customer behavior, product performance, and regional performance. Finally, an interactive and professional dashboard was created.

REQUIREMENT ANALYSIS

The project requirements included analyzing sales performance across different dimensions such as customers, products, categories, regions, and time periods. The project also required the creation of calculated measures, trend analysis, discount and profitability analysis, and data transformation using Power Query.

Additionally, the project required the creation of multiple charts and dashboards to visually represent insights and support business analysis.

OTHER PARAMETERS DEPENDING ON THE PROJECT

The project requirements included analyzing sales performance across different dimensions such as customers, products, categories, regions, and time periods. The project also required the creation of calculated measures, trend analysis, discount and profitability analysis, and data transformation using Power Query.

Additionally, the project required the creation of multiple charts and dashboards to visually represent insights and support business analysis.

VISUALIZATION (CHARTS & DASHBOARD)

Figure 1: Total Sales by Customer Name

Figure 2 : Top 10 Products by Sales

Explanation: This chart identifies the highest revenue-Generating products, which are critical for business Growth

Figure 3: Running Total Sales Over Time

Explanation: This chart represents cumulative sales growth, helping track business expansion over time

Figure 4: Total sales Tax by Product Category

Explanation: This chart shows the distribution of calculated sales tax across product categories.

Figure 5: Profit by Region

Explanation: This chart highlights regional performance and identifies high-performing and low-performing markets.

Figure 6: Profit & Sales by category

Explanation: These visual compares total sales and profit across different product categories, helping evaluate profitability

INSIGHTS FROM THE CHARTS AS WELL AS DASHBOARDS

- The analysis shows that a few regions contribute a major portion of total sales.
- Certain product categories generate high sales but lower profit margins due to discounts.
- A small group of customers contributes significantly to overall revenue.
- Sales trends indicate seasonal patterns across different months.
- Discounts have a noticeable impact on profitability.

CONCLUSION

The Sales Analysis Dashboard successfully transforms raw sales data into meaningful insights using Power BI. The dashboard helps in understanding sales trends, customer behavior, product performance, and regional contributions.

This project demonstrates how data visualization and business analytics can support informed decision-making. It also provided hands-on experience in using Power BI, Power Query, and DAX for real-world business analysis.
